Diazocoupling reaction pdf

Illustration of organic chemistry glossary. Related terms: Conjugation of Wikipedia entries Back to the glossary index. Descriptive of diazoionium cation reactions indicates that covalent cationic charge is located over two nitrogen atoms. It is impossible for nucleophiles to bond with inner nitrogen, but negative nucleophile bonds (or connectors) to terminal nitrogen provide necessary stabilities. Diazocouplings are used in organic synthesis and contain diazonium cation intermediates. These cations are often referred to as diazonium cations. Related terms: diazonium cation, diazonium salt.
